

Terraform Project Multi Region

Multi Region

- Project deployment was a great success
- Time to deploy infrastructure in production environment
 - Development environment = us-west-2
 - Production environment = us-east-1
- Deploy same infrastructure with same configuration
- How do we do this?

Multi Region

- Two options: Setup a provider alias for us-east-1, or create a new project directory
 - Aliases are great for simple, small usecases
 - Can get difficult to read very quickly, not recommended
 - Create new project directory improves readability and easier to manage
- Setup new state file
 - Never use same state file for multiple environments
- Spoiler: There will be lots of copy & paste
 - Next section covers Modules - recommended approach
